Let's go through a **step-by-step, practical guide** for migrating emails from **Windows 11 Outlook** (desktop app, usually .pst format) to **Thunderbird**. I'll focus on the modern, fully-supported method using Thunderbird's built-in tools.

Migrating Outlook Emails to Thunderbird (Step-by-Step)

Goal: Import all your old emails, folders, and attachments from Outlook into Thunderbird on your Windows 11 machine.

Step 0: Prepare

1. Check your Outlook version

- Desktop Outlook (Microsoft 365, 2019, 2016, etc.) stores emails in .pst files.
- Make sure Outlook is **installed and working**; you don't need to export manually yet, Thunderbird can access it directly.

2. Install Thunderbird

- Download the latest version: <https://www.thunderbird.net>
- Install on Windows 11.

3. Close Outlook temporarily

- Make sure Outlook is **not running** while importing to prevent file lock issues.
-

Step 1: Prepare Thunderbird to Import

1. Open Thunderbird.
 2. Go to **Tools** → **Import** (or Menu → Tools → Import on newer versions).
-

3. Choose **“Mail”** → Click **Next**.
4. Choose **“Outlook”** as the source → Click **Next**.

Thunderbird will automatically detect installed Outlook profiles.

Step 2: Select Outlook Profile / Account

1. Thunderbird will show a list of Outlook profiles (usually only one).
2. Select the profile you want to import (default is often named **Outlook**).
3. Click **Next** → Thunderbird will start scanning and importing emails.

This may take **several minutes to hours** depending on mailbox size.

Step 3: Confirm Imported Mail

1. After import completes, Thunderbird creates a new folder (usually called **“On My Computer → Imported Mail”**).
2. Check that your **folders, emails, and attachments** are all present.

Tip: Large mailboxes may appear nested; check subfolders carefully.

Step 4: Organize Mail in Thunderbird

1. Move imported folders to preferred locations:
 - Drag and drop into existing Thunderbird folders if needed.
 - Rename folders for clarity.
 2. Optionally, **set up your email account in Thunderbird** (IMAP/POP) to sync new emails:
 - IMAP keeps emails on the server (best for Gmail, Outlook.com).
 - POP downloads emails locally.
-

Step 5: Backup Imported Mail

1. Thunderbird stores local emails in the **profile folder**:
 - Windows path: `C:\Users\<username>\AppData\Roaming\`
-

Thunderbird\Profiles\<random>.default\Mail

2. Optional: Copy this folder to an external drive for safety.
-

Step 6: Verify & Test

1. Open several emails to check attachments and formatting.
 2. Send a test email from Thunderbird to ensure account is working.
-

Notes & Tips

- No third-party tools are needed nowadays; **Thunderbird handles PST import natively**.
 - If import fails:
 - Make sure Outlook is installed and has the profile active.
 - Run Thunderbird as **administrator** to allow it access to Outlook files.
 - For multiple Outlook profiles, repeat the import for each profile.
 - Imported mail is **local**, not synced with server — IMAP setup is recommended for ongoing email sync.
